CUSTOMERS, CHANNELS & DEMAND

NxtGen.

Customer demand, made clear.

A shared view of sales channels and a transparent plan for the next two weeks.

TEAM NXTGEN

Working prototype / Synthetic demonstration

The weekly planning gap

WHO

Small retail teams

Selling the same products through direct orders, marketplaces, social channels, and shops.

WHAT THEY NEED TO KNOW

Which products are moving?

How does revenue compare with channel spend?

Could current stock cover the next two weeks?

Separate exports make these questions harder to answer in one place. This is our design hypothesis. Customer interviews and measured outcomes are future validation work.

One CSV. A shared demand view.

Import aggregate sales, compare the selected period, and export a plan with the assumptions attached.

REVENUE (INR)

7,975,680

ORDERS

7,413

UNITS SOLD

9,481

Overview filters update the totals, daily trend, product ranking, and revenue mix. The latest date in the file anchors the reporting period.

Computed demo: 29 September to 26 October 2026. 672 synthetic source rows over 56 days. Amounts use INR. No real customer data.

Channel efficiency, with context

CHANNEL	REVENUE (INR)	SPEND (INR)	REV / SPEND	COST / NEW
Retail	2,534,460	304,136	8.33x	528
Social	2,175,390	543,853	4.00x	355
Marketplace	1,814,640	326,635	5.56x	319
Direct	**1,451,190**	**101,591**	**14.28x**	**242**

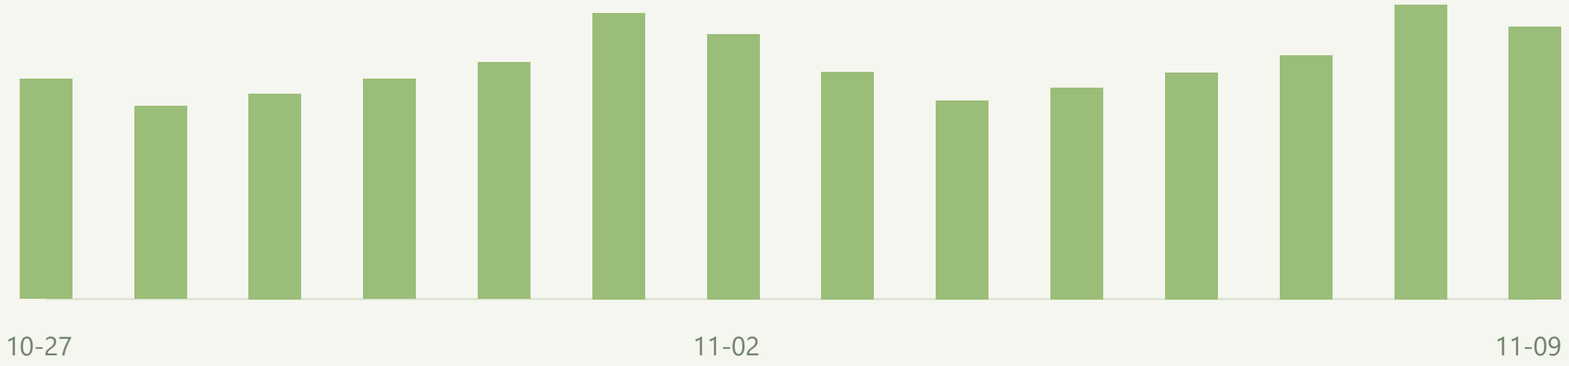
In this synthetic example, Direct has the highest recorded revenue per rupee of spend. A team could review margin and capacity before testing a budget change.

Ratios are descriptive. They do not measure profit or causal attribution. Supplied new-customer counts can overlap across channels.

A transparent two-week stock scenario

5,132 projected units

Recent weekday pattern + a capped weekly trend



1,000 units available

4,132 units below the baseline

10,000 units available

4,868 units above the baseline

At least 14 observed dates required. Weekly trend capped at +/-25%. The +/-20% planning band is not a confidence interval. Review SKU stock and lead times before ordering.

Simple to run. Private by design.

BROWSER APPLICATION

Static HTML, CSS, and JavaScript modules.
No API key, database, or dependency installation.
Imported CSV stays in memory for the session.

RELIABILITY

Nine automated tests cover parsing, input validation, date windows, aggregation, and forecast edge cases. The local server responds successfully.

Prototype scope: aggregate CSV analysis. Commerce connectors, customer deduplication, and automated purchasing are future work.

A clear next step for validation

AVAILABLE NOW

Working application and source code
CSV import and downloadable action plan
Setup guide, deployment workflow, and MIT license

NEXT VALIDATION

Test the planning workflow with retailers. Backtest against a seasonal-naive baseline. Add product-level inventory and supplier lead times before a stock-planning pilot.
